Job Application for DevOps Engineer

Dear Mr. Mulder,

About Me

I am an Italian computer scientist and generally a tech enthusiast. My work experience ranges from webmaster to fullstack developer to DevOps engineer, developing a wide range of products for small businesses, hardware producing companies and large businesses in the service field. I am a team player and I like facing new challenges with an eye on exploration of new technologies. I covered multiple roles in the various companies I worked for and I take the team onboarding in the technical design as a personal mission.

Why LeasePlan?

LeasePlan is a well-known company in the market, facing peculiar challenges due to the high volume of traffic and customers. It combines the business knowledge of a large experienced company with the flexibility requested by the size and distribution for both its market segment and human resources. To solve the flexibility challenge and stay ahead of the market the company is now considering new tools and refresh the legacy solutions that worked so far, exploring fields like microservices, Rest APIs, container, CI/CD and cloud solutions to deploy and run the business critical applications, making it the perfect candidate for my technical and professional evolution.

Why Me?

The technical background and the eterogeneous range of interests, along with the passion to discover and try out new technologies makes me the perfect match for a company that is willing to evolve his stack with the modern products available on the market. I previously worked in a professional environment with most of the technologies of interest for your company (such as AWS, Azure, CI/CD and API management) or with comparable competitors (DCOS - Kubernetes).

Sincerely,

Marco Nicotra
